🔗 Pranav-Acharya1

Profile

Accomplished **Nanoelectronic Engineering PhD** and **Masters in Theoretical Physics**, with experience in **quantum transport modelling** and **device physics**. Published **4 first author papers** [1–4] leveraging **Non-Equilibrium Green's Function (NEGF)** to quantify the impact of device variation on **Resonant Tunneling Diodes (RTDs)**. This variation was shown to be able to encode information, hence RTDs can compose **Physical Uncloneable Functions (PUFs)**. Seeking a **Research Scientist** role to apply physics theory in the development of **next-generation quantum and nano-electronic devices**.

Skills

Nanoelectronic Device Modelling

- Modelled impact of device variation on quantum tunnelling based devices (RTDs) using Non-Equilibrium Green's Function (NEGF) formalism, delivering **4 first-author research projects** [1–4]
- Diverse modelling expertise**, including **RTDs** [1, 2, 4], **nanosheet transistors** [5, 6], and **quantum dots**

Computational Physics and Programming

- Extended the device variation capability [1–4] of custom **TCAD software** written in **C++**, using **Git** for version control, and utilised **Python** (Numpy, Scipy, Matplotlib) and Matlab for numerical analysis and data post-processing
- Collaborated to accelerate simulations **by 60%** using a **Diffusion ML model** (SISPAD conference paper) [5]
- Automated simulation on Linux HPC environments using Python scripts and queue managers (Slurm/SGE)

Research Communication and Engagement

- Presented research at the international **EuroSOI-ULIS 2024** [1] conference and wrote a **blog** for a wider audience
- Team player with a strong research presence [1–4], who coauthored further peer reviewed research papers [5, 6]

Education

PhD, Nanoelectronic Engineering, **University of Glasgow**

2021-2025

- Simulation of Resonant Tunnelling Diodes with the Non-Equilibrium Green's Function Formalism**

MPhys, Theoretical Physics, **First class honours**, **Lancaster University**

2017-2021

- Thesis project: Quantum Monte Carlo simulations of 3D type 2 Quantum Dots
